Filtered completed-case reference. The following figures reproduce the completed-case input corpus. The raw-data comparison follows.

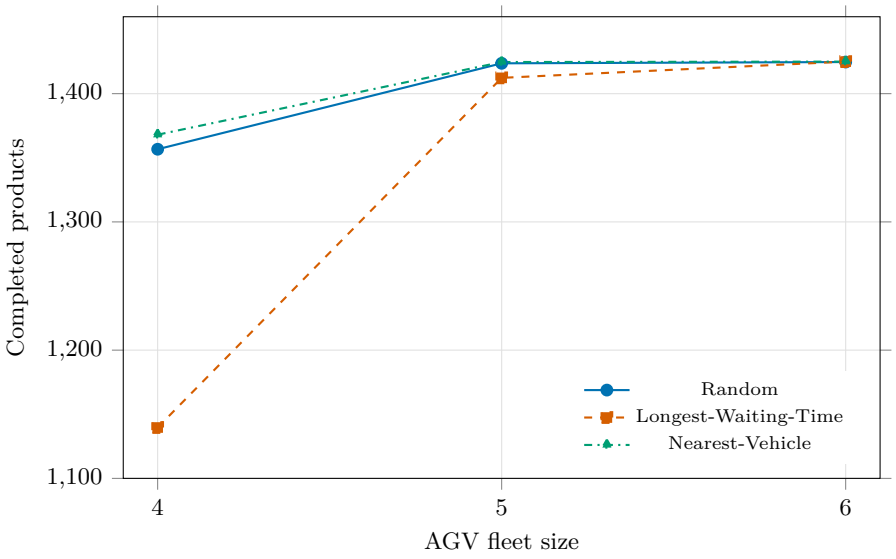

Figure 1: Throughput by fleet size and dispatch policy, averaged over the three driving directions.

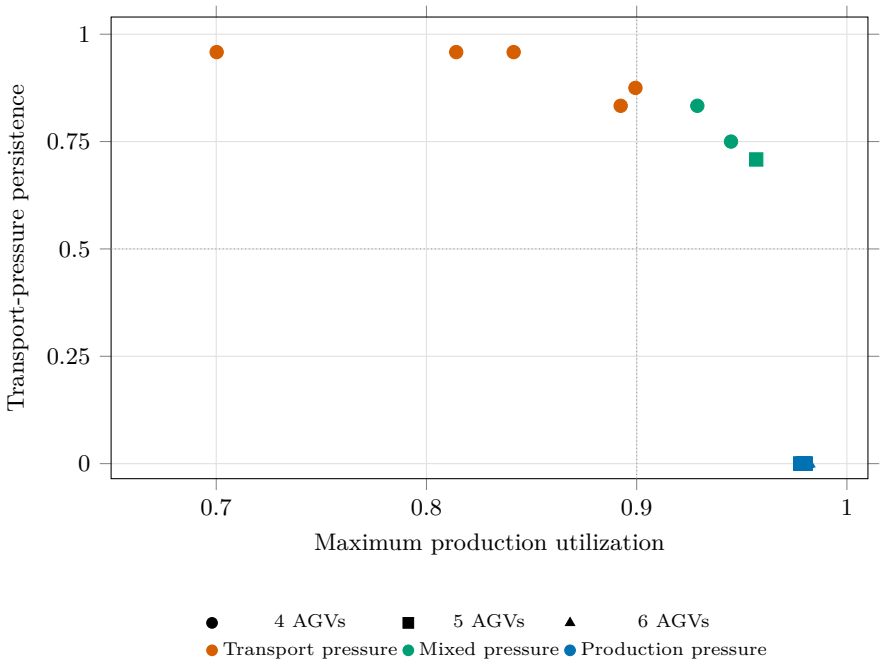

Figure 2: RTBD evidence for all 27 filtered logs. Coincident markers can overlap. Colors show the computed regime; production pressure also requires Welding–Painting joint persistence. Dotted lines show the 0.90 saturation and 0.50 transport-persistence cutoffs.

Raw-data sensitivity. All raw cases are included; unfinished intervals are right-censored at the 24-hour observation boundary.

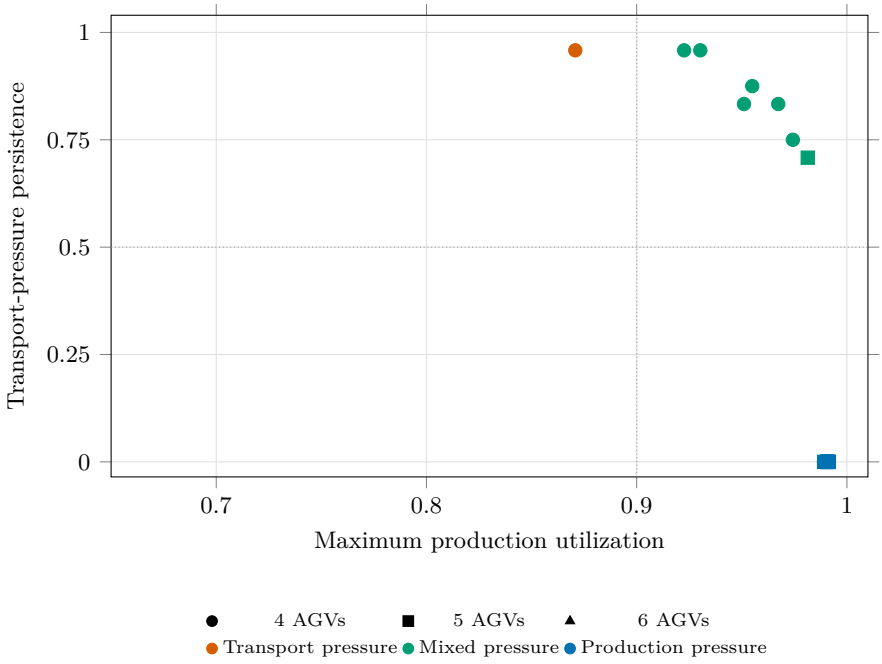

Figure 3: Raw-log evidence. Four four-AGV configurations change from transport pressure with low completed-case production exposure to mixed pressure. Throughput is unchanged.

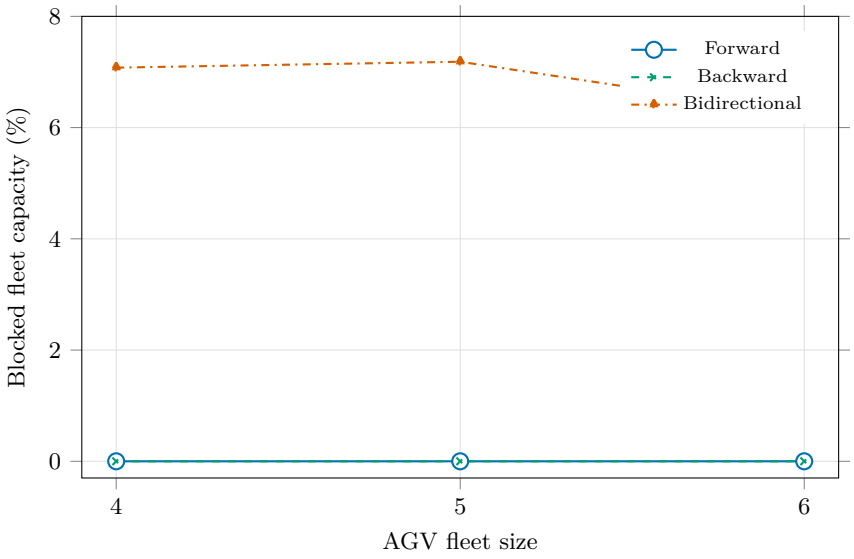

Figure 4: Supplementary filtered-log figure: blocked fleet-capacity time by fleet size and direction. Forward and Backward are both zero.

Original native pipeline.

Figure 5: Generic measurement layer and application-specific interpretation, retained from the supplied manuscript.
